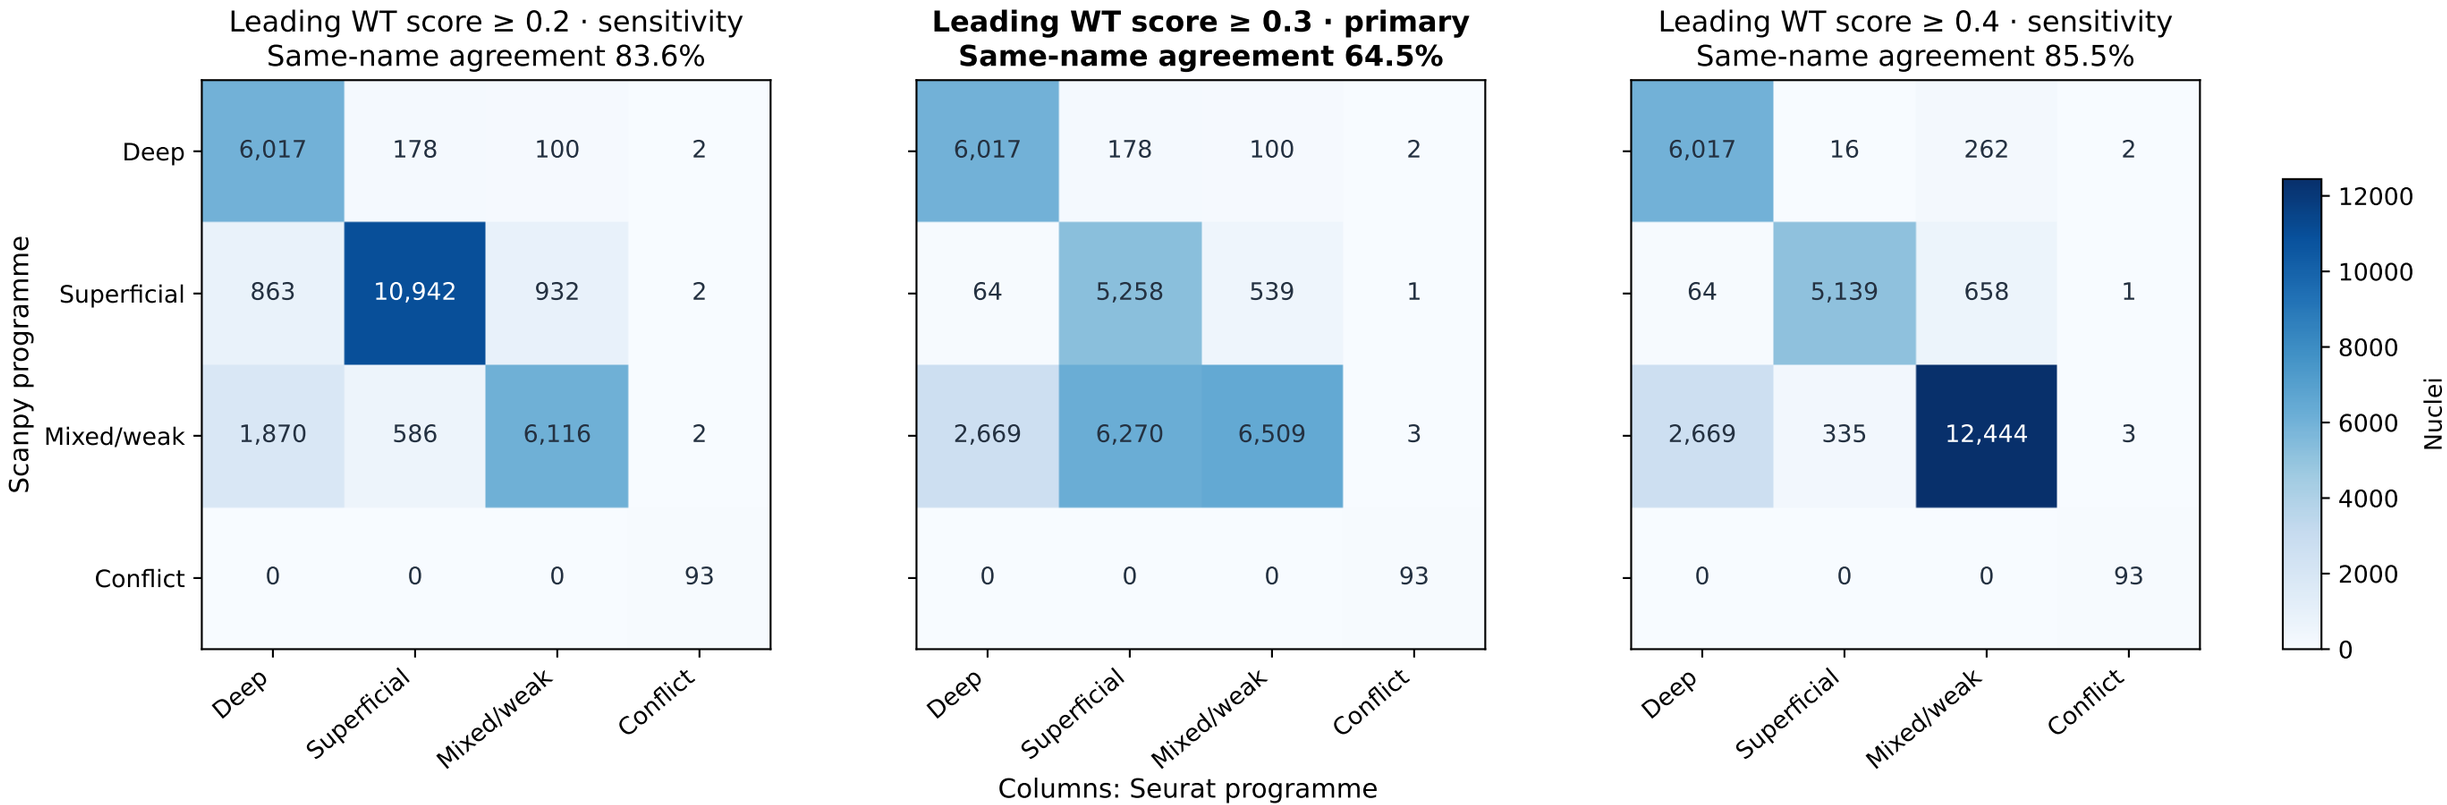
CA1-ProS expression programmes: same names require the same membership evidence

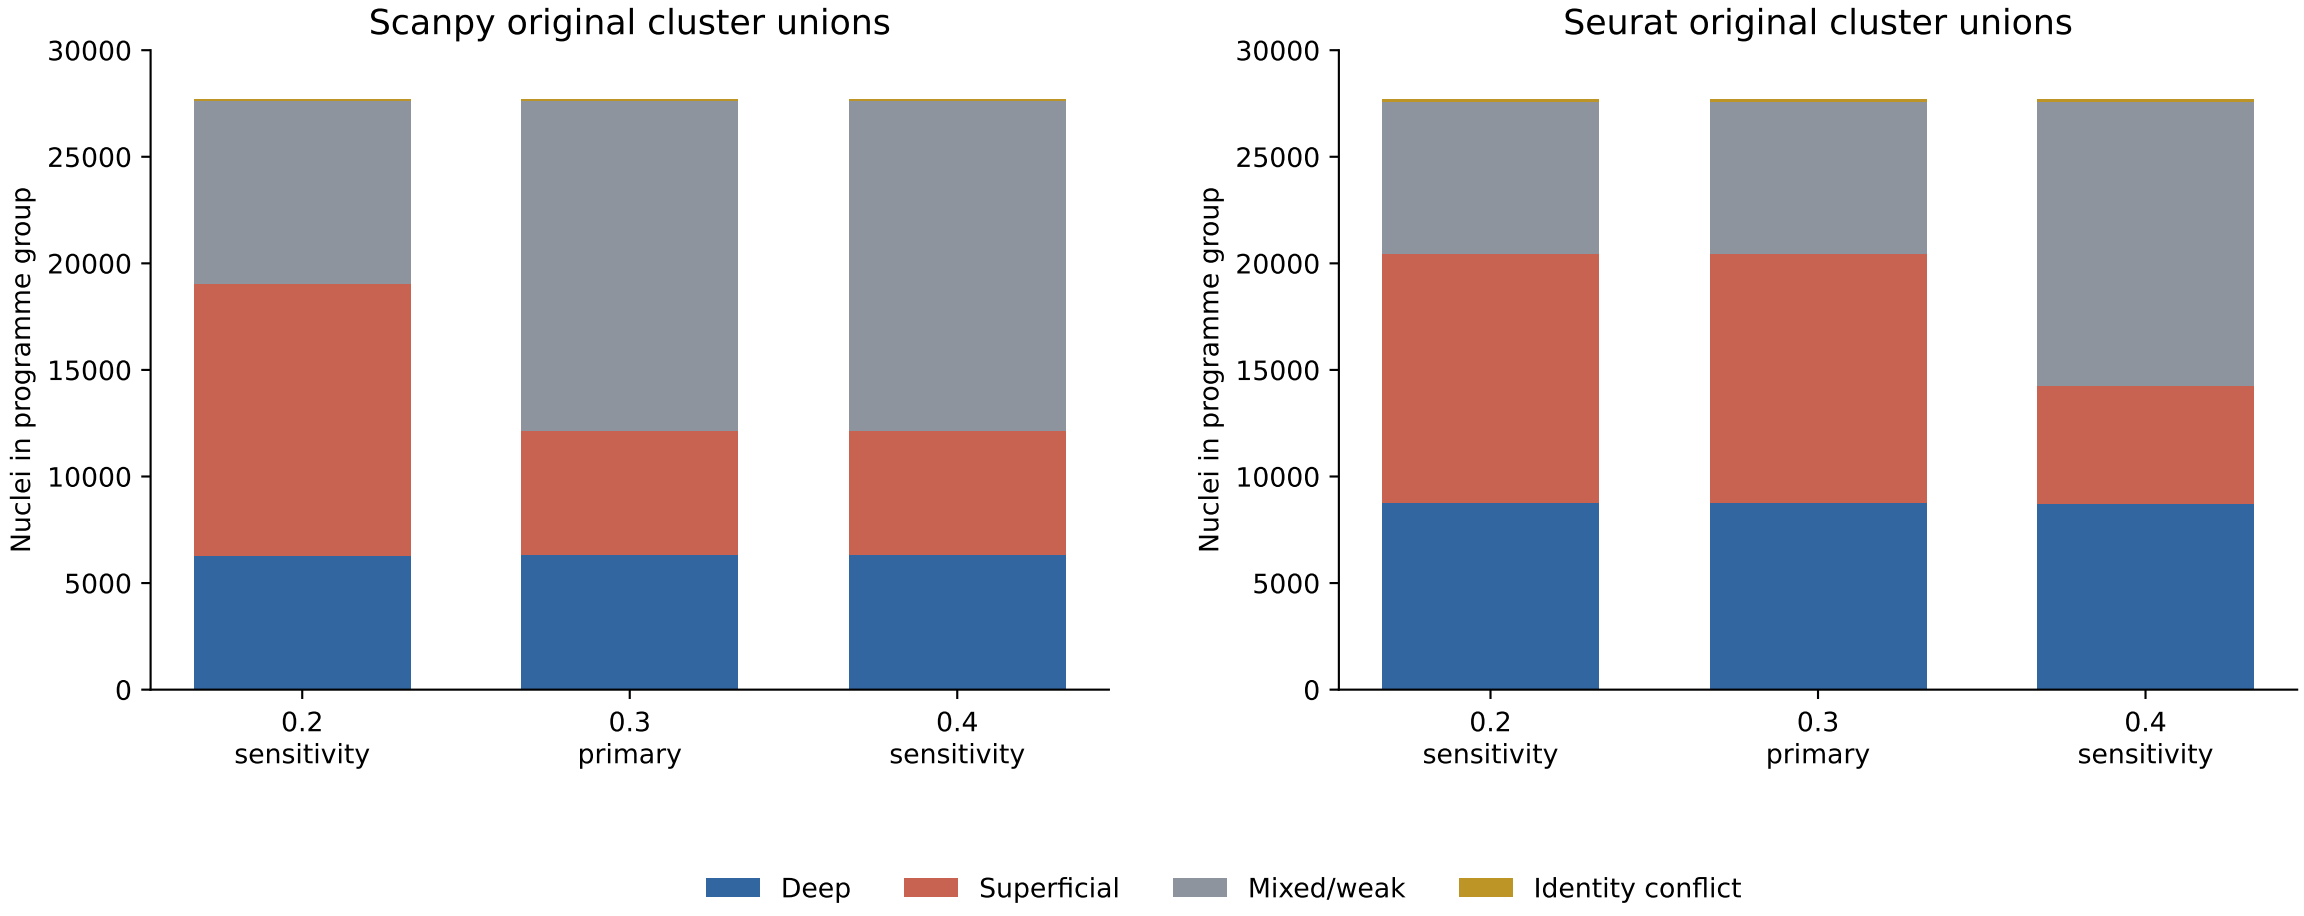
27,703 identical original nuclei · original-full WT scores · exact counts, no label permutation



Fixed guards: score gap ≥0.5; ≥3 genes detected in ≥10% of WT cluster; ≥20 WT nuclei/≥3 WT mice.
Conflict groups remain unassigned. These are expression-associated programmes; physical layers are undetermined.
Threshold changes are read-only sensitivity views. Actual .3 pseudobulk/DE memberships remain unchanged.

Programme size depends on original graph partitions and the declared score threshold

WT gene scores are standardized within each tool’s original clusters; equal names do not imply equal cell sets.



Borderline groups: Scanpy2 superficial score 0.200176; Seurat2 0.308745.
Primary .3: Scanpy2 is mixed/weak; Seurat2 is superficial-associated. Raising/lowering the threshold changes this distinction.
No additional model or raw RNA aggregation was performed; no anatomical layer-loss conclusion follows.
